MCP9800/1/2/3

2-Wire High-Accuracy Temperature Sensor
Features:

- Temperature-to-Digital Converter
- Accuracy with 12-bit Resolution:
  - ±0.5°C (typical) at +25°C
  - ±1°C (maximum) from -10°C to +85°C
  - ±2°C (maximum) from -10°C to +125°C
  - ±3°C (maximum) from -55°C to +125°C
- User-selectable Resolution: 9–12 bit
- Operating Voltage Range: 2.7V to 5.5V
- 2-wire Interface: I²C™/SMBus Compatible
- Operating Current: 200 µA (typical)
- Shutdown Current: 1 µA (maximum)
- Power-saving One-shot Temperature Measurement
- Available Packages: SOT-23-5, MSOP-8, SOIC-8

Typical Applications:

- Personal Computers and Servers
- Hard Disk Drives and Other PC Peripherals
- Entertainment Systems
- Office Equipment
- Data Communication Equipment
- Mobile Phones
- General Purpose Temperature Monitoring

Typical Application

Description:

Microchip Technology Inc.'s MCP9800/1/2/3 family of digital temperature sensors converts temperatures between -55°C and +125°C to a digital word. They provide an accuracy of ±1°C (maximum) from -10°C to +85°C.

The MCP9800/1/2/3 family comes with user-programmable registers that provide flexibility for temperature sensing applications. The register settings allow user-selectable 9-bit to 12-bit temperature measurement resolution, configuration of the power-saving Shutdown and One-shot (single conversion on command while in Shutdown) modes and the specification of both temperature alert output and hysteresis limits. When the temperature changes beyond the specified limits, the MCP9800/1/2/3 outputs an alert signal. The user has the option of setting the alert output signal polarity as an active-low or active-high comparator output for thermostat operation, or as temperature event interrupt output for microprocessor-based systems.

This sensor has an industry standard 2-wire, I²C™/ SMBus compatible serial interface, allowing up to eight devices to be controlled in a single serial bus. These features make the MCP9800/1/2/3 ideal for sophisticated multi-zone temperature-monitoring applications.

Package Types

MCP9800/02A0: A2, A1, A0 are internally set to (0, 0, 0)

MCP9800/02A5: A2, A1, A0 are internally set to (1, 0, 1)

MCP9802/03: Serial Bus time-out 35 ms (typ.)

NOTES:

1.0 ELECTRICAL CHARACTERISTICS

Absolute Maximum Ratings †

V_{DD} 6.0V

Voltage at all Input/Output pins ..... GND – 0.3V to 5.5V

Storage temperature .... -65°C to +150°C

Ambient temp. with power applied ..... -55°C to +125°C

Junction Temperature (T_J) .... 150°C

ESD protection on all pins (HBM:MM) .... (4 kV:400V)

Latch-Up Current at each pin .... ±200 mA

†Notice: Stresses above those listed under "Maximum ratings" may cause permanent damage to the device. This is a stress rating only and functional operation of the device at those or any other conditions above those indicated in the operational listings of this specification is not implied. Exposure to maximum rating conditions for extended periods may affect device reliability.

DC CHARACTERISTICS

Electrical Specifications: Unless otherwise indicated, V_{DD} = 2.7V to 5.5V, GND = Ground, and T_A = -55°C to +125°C.

3.0 PIN DESCRIPTION

The descriptions of the pins are listed in Table 3-1.

TABLE 3-1: PIN FUNCTION TABLE

MCP9800 MCP9802 SOT-23-5	MCP9801 MCP9803 MSOP, SOIC	Symbol	Function
5	1	SDA	Bidirectional Serial Data
4	2	SCLK	Serial Clock Input
3	3	ALERT	Temperature Alert Output
2	4	GND	Ground
—	5	A2	Address Select Pin (bit 2)
—	6	A1	Address Select Pin (bit 1)
—	7	A0	Address Select Pin (bit 0)
1	8	V_{DD}	Power Supply Input

3.1 Serial Data Pin (SDA)

The SDA is a bidirectional input/output pin, used to serially transmit data to and from the host controller. This pin requires a pull-up resistor to output data.

3.2 Serial Clock Pin (SCLK)

The SCLK is a clock input pin. All communication and timing is relative to the signal on this pin. The clock is generated by the host controller on the bus.

3.3 Power Supply Input (V_{DD})

The V_{DD} pin is the power pin. The operating voltage, as specified in the DC electrical specification table, is applied on this pin.

3.4 Ground (GND)

The GND pin is the system ground pin.

3.5 ALERT Output

The MCP9800/1/2/3's ALERT pin is an open-drain output pin. The device outputs an alert signal when the ambient temperature goes beyond the user-programmed temperature limit.

3.6 Address Pins (A2, A1, A0)

These pins are device or slave address input pins and are available only with the MCP9801/03. The device addresses for the MCP9800/02 are factory-set.

The address pins are the Least Significant bits (LSb) of the device address bits. The Most Significant bits (MSb) (A6, A5, A4, A3) are factory-set to <1001>. This is illustrated in Table 3-2.

TABLE 3-2: SLAVE ADDRESS

Device	A6	A5	A4	A3	A2	A1	A0
MCP9800/02A0	1	0	0	1	0	0	0
MCP9800/02A5	1	0	0	1	1	0	1
MCP9801/03	1	0	0	1	X	X	X

Note: User-selectable address is shown by X.

NOTES:

4.0   SERIAL COMMUNICATION

4.1   2-Wire SMBus/Standard Mode I^{2}C™ Protocol-Compatible Interface

The MCP9800/1/2/3 serial clock input (SCL) and the bidirectional serial data line (SDA) form a 2-wire bidirectional SMBus/Standard mode I^{2}C compatible communication port (refer to the **Digital Input/Output Pin Characteristics Table** and **Serial Interface Timing Specifications Table**).

The following bus protocol has been defined:

TABLE 4-1:   MCP9800 SERIAL BUS PROTOCOL DESCRIPTIONS

Term	Description
Master	The device that controls the serial bus, typically a microcontroller.
Slave	The device addressed by the master, such as the MCP9800/1/2/3.
Transmitter	Device sending data to the bus.
Receiver	Device receiving data from the bus.
Start	A unique signal from master to initiate serial interface with a slave.
Stop	A unique signal from the master to terminate serial interface from a slave.
Read/Write	A read or write to the MCP9800/1/2/3 registers.
ACK	A receiver Acknowledges (ACK) the reception of each byte by polling the bus.
NAK	A receiver Not-Acknowledges (NAK) or releases the bus to show End-of-Data (EOD).
Busy	Communication is not possible because the bus is in use.
Not Busy	The bus is in the Idle state, both SDA and SCL remain high.
Data Valid	SDA must remain stable before SCL becomes high in order for a data bit to be considered valid. During normal data transfers, SDA only changes state while SCL is low.

4.1.1   DATA TRANSFER

Data transfers are initiated by a Start condition (Start), followed by a 7-bit device address and a read/write bit. An Acknowledge (ACK) from the slave confirms the reception of each byte. Each access must be terminated by a Stop condition (Stop).

Repeated communication is initiated after t_{B-FREE}.

This device does not support sequential register read/ write. Each register needs to be addressed using the Register Pointer.

This device supports the Receive Protocol. The register can be specified using the pointer for the initial read. Each repeated read or receive begins with a Start condition and address byte. The MCP9800/1/2/3 retains the previously selected register. Therefore, it outputs data from the previously-specified register (repeated pointer specification is not necessary).

4.1.2   MASTER/SLAVE

The bus is controlled by a master device (typically a microcontroller) that controls the bus access and generates the Start and Stop conditions. The MCP9800/1/2/3 is a slave device and does not control other devices in the bus. Both master and slave devices can operate as either transmitter or receiver. However, the master device determines which mode is activated.

4.1.3   START/STOP CONDITION

A high-to-low transition of the SDA line (while SCL is high) is the Start condition. All data transfers must be preceded by a Start condition from the master. If a Start condition is generated during data transfer, the MCP9800/1/2/3 resets and accepts the new Start condition.

A low-to-high transition of the SDA line (while SCL is high) signifies a Stop condition. If a Stop condition is introduced during data transmission, the MCP9800/1/ 2/3 releases the bus. All data transfers are ended by a Stop condition from the master.

4.1.4   ADDRESS BYTE

Following the Start condition, the host must transmit an 8-bit address byte to the MCP9800/1/2/3. The address for the MCP9800 Temperature Sensor is '1001,A2,A1,A0' in binary, where the A2, A1 and A0 bits are set externally by connecting the corresponding pins to V_{DD} '1' or GND '0'. The 7-bit address transmitted in the serial bit stream must match the selected address for the MCP9800/1/2/3 to respond with an ACK. Bit 8 in the address byte is a read/write bit. Setting this bit to '1' commands a read operation, while '0' commands a write operation (see Figure 4-1).
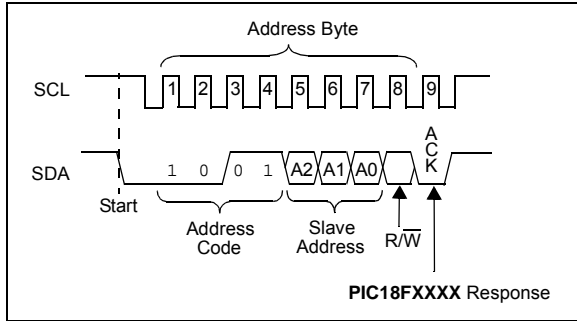

MCP9800/1/2/3

FIGURE 4-1: *Device Addressing.*

4.1.5 DATA VALID

After the Start condition, each bit of data in transmission needs to be settled for a time specified by $t_{SU-DATA}$ before SCL toggles from low-to-high (see **"Serial Interface Timing Specifications" on Page 5**).

4.1.6 ACKNOWLEDGE (ACK)

Each receiving device, when addressed, is obliged to generate an ACK bit after the reception of each byte. The master device must generate an extra clock pulse for ACK to be recognized.

The acknowledging device pulls down the SDA line for $t_{SU-DATA}$ before the low-to-high transition of SCL from the master. SDA also needs to remain pulled down for t_{H-DATA} after a high-to-low transition of SCL.

During read, the master must signal an End-of-Data (EOD) to the slave by not generating an ACK bit (NAK) once the last bit has been clocked out of the slave. In this case, the slave will leave the data line released to enable the master to generate the Stop condition.

5.0 FUNCTIONAL DESCRIPTION

The MCP9800/1/2/3 temperature sensor consists of a band-gap type temperature sensor, a $\Sigma\Delta$ Analog-to-Digital Converter (ADC), user-programmable registers and a 2-wire I^2C protocol-compatible serial interface.
FIGURE 5-1: *Functional Block Diagram.*

5.1 Temperature Sensor

The MCP9800/1/2/3 uses the difference in the base-emitter voltage of a transistor while its collector current is changed from IC_1 to IC_2. With this method, the ΔV_{BE} depends only on the ratio of the two currents and the ambient temperature, as shown in Equation 5-1.

EQUATION 5-1:

$$\Delta V_{BE} = \left(\frac{kT}{q}\right) \times ln(IC_1/IC_2)$$

Where:

T	=	temperature in kelvin
ΔV_{BE}	=	change in diode base-emitter voltage
k	=	Boltzmann's constant
q	=	electron charge
IC_1 and IC_2	=	currents with n:1 ratio

5.2 $\Sigma\Delta$ Analog-to-Digital Converter

A Sigma-Delta ADC is used to convert ΔV_{BE} to a digital word that corresponds to the transistor temperature. The converter has an adjustable resolution from 0.5°C (at 30 ms conversion time) to 0.0625°C (at 240 ms conversion time). Thus, it allows the user to make trade-offs between resolution and conversion time. Refer to **Section 5.3.2 "Sensor Configuration Register (CONFIG)"** and **Section 5.3.4.7 "$\Sigma\Delta$ ADC Resolution"** for details.

MCP9800/1/2/3

5.3 Registers

The MCP9800/1/2/3 has four registers that are user-accessible. These registers are specified as the Ambient Temperature (T_A) register, the Temperature Limit-set (T_{SET}) register, the Temperature Hysteresis (T_{HYST}) register and device Configuration (CONFIG) register.

The Ambient Temperature register is a read-only register and is used to access the ambient temperature data. The data from the ADC is loaded in parallel in the register. The Temperature Limit-set and Temperature Hysteresis registers are read/write registers that provide user-programmable temperature limits. If the ambient temperature drifts beyond the programmed limits, the MCP9800/1/2/3 outputs an alert signal using the ALERT pin (refer to **Section 5.3.4.3 "ALERT Output Configuration"**). The device Configuration register provides access for the user to configure the MCP9800/1/2/3's various features. These registers are described in further detail in the following sections.

The registers are accessed by sending Register Pointers to the MCP9800/1/2/3 using the serial interface. This is an 8-bit pointer. However, the two Least Significant bits (LSbs) are used as pointers and all other bits need to be cleared <0>. This device has additional registers that are reserved for test and calibration. If these registers are accessed, the device may not perform according to the specification. The pointer description is shown below.
FIGURE 5-2:   *Register Block Diagram.*

MCP9800/1/2/3

5.3.1 AMBIENT TEMPERATURE REGISTER (T$_A$)

The MCP9800/1/2/3 has a 16-bit read-only Ambient Temperature register that contains 9-bit to 12-bit temperature data. (0.5°C to 0.0625°C resolutions, respectively). This data is formatted in two's complement. The bit assignments, as well as the corresponding resolution, is shown in the register assignment below.

The refresh rate of this register depends on the selected ADC resolution. It takes 30 ms (typical) for 9-bit data and 240 ms (typical) for 12-bit data. Since this register is double-buffered, the user can read the register while the MCP9800/1/2/3 performs Analog-to-Digital conversion in the background. The decimal code to ambient temperature conversion is shown in Equation 5-2:

EQUATION 5-2:

$$T_A = \text{Code} \times 2^{-4}$$

Where:

T_A = Ambient Temperature (°C)

Code = MCP9800 output in decimal

MCP9800/1/2/3

5.3.2 SENSOR CONFIGURATION REGISTER (CONFIG)

The MCP9800/1/2/3 has an 8-bit read/write Configuration register that allows the user to select the different features. These features include shutdown, ALERT output select as comparator or interrupt output, ALERT output polarity, fault queue cycle, temperature measurement resolution and One-shot mode (single conversion while in shutdown). These functions are described in detail in the following sections.

REGISTER 5-3: CONFIGURATION REGISTER (CONFIG) – ADDRESS <0000 0001>b

MCP9800/1/2/3

5.3.3 TEMPERATURE HYSTERESIS REGISTER (T_{HYST})

The MCP9800/1/2/3 has a 16-bit read/write Temperature Hysteresis register that contains a 9-bit data in two's compliment format. This register is used to set a hysteresis for the T_{SET} limit. Therefore, the data represents a minimum temperature limit. If the ambient temperature drifts below the specified limit, the MCP9800/1/2/3 asserts an alert output (refer to **Section 5.3.4.3 "ALERT Output Configuration"**).

This register uses the nine Most Significant bits (MSbs) and all other bits are "don't cares".

The power-up default value of T_{HYST} register is 75°C, or `<0100 1011 0>b` in binary.

MCP9800/1/2/3

5.3.4 TEMPERATURE LIMIT-SET REGISTER (T_{SET})

The MCP9800/1/2/3 has a 16-bit read/write Temperature Limit-Set register (T_{SET}) which contains a 9-bit data in two's compliment format. This data represents a maximum temperature limit. If the ambient temperature exceeds this specified limit, the MCP9800/1/2/3 asserts an alert output. (Refer to **Section 5.3.4.3 "ALERT Output Configuration"**).

This register uses the nine Most Significant bits (MSbs) and all other bits are "don't cares".

The power-up default value of the T_{SET} register is 80°C, or `<0101 0000 0>b` in binary.

REGISTER 5-5: TEMPERATURE LIMIT-SET REGISTER (T_{SET}) – ADDRESS `<0000 0011>b`

Upper Half:

R/W-0	R/W-1	R/W-0	R/W-1	R/W-0	R/W-0	R/W-0	R/W-0
Sign	2^6 °C	2^5 °C	2^4 °C	2^3 °C	2^2 °C	2^1 °C	2^0 °C
bit 15							bit 8

Lower Half:

R/W-0	R-0	R-0	R-0	R-0	R-0	R-0	R-0
2^{-1} °C	0	0	0	0	0	0	0
bit 7							bit 0

Legend:

R = Readable bit	W = Writable bit	U = Unimplemented bit, read as '0'
-n = Value at POR	'1' = Bit is set	'0' = Bit is cleared x = Bit is unknown

FIGURE 5-6: *Timing Diagram for Writing and Reading from the Temperature Limit-set Register (See Section 5.3.4 "Temperature Limit-Set Register (T_{SET})").*

5.3.4.1   Shutdown Mode

The Shutdown mode disables all power-consuming activities (including temperature sampling operations) while leaving the serial interface active. The device consumes 2 µA (maximum) in this mode. It remains in this mode until the Configuration register is updated to enable continuous conversion or until power is recycled.

In Shutdown mode, the CONFIG, T_A, T_{SET} and T_{HYST} registers can be read or written to; however, the serial bus activity will increase the shutdown current.

5.3.4.2   One-Shot Mode

The MCP9800/1/2/3 can also be used in a One-shot mode that can be selected using bit 7 of the CONFIG register. The One-shot mode performs a single temperature measurement and returns to Shutdown mode. This mode is especially useful for low-power applications where temperature is measured upon command from a controller. For example, a 9-bit T_A in One-shot mode consumes 200 µA (typical) for 30 ms and 0.1 µA (typical) during shutdown.

To access this feature, the device needs to initially be in Shutdown mode. This is done by sending a byte to the CONFIG register with bit 0 set <1> and bit 7 cleared <0>. Once the device is in Shutdown mode, the CONFIG register needs to be written to again, with bit 0 and bit 7 set <1>. This begins the single conversion cycle of t_{CONV}, 30ms for 9-bit data. Once the conversion is completed, T_A is updated and bit 7 of CONFIG becomes cleared <0> by the MCP9800/1/2/3.

TABLE 5-2:   SHUTDOWN AND ONE-SHOT MODE DESCRIPTION

Operational Mode	One-Shot (Bit 7)	Shutdown (Bit 0)
Continuous Conversion	0	0
Shutdown	0	1
Continuous Conversion (One-shot is ignored)	1	0
One-shot (Note 1)	1	1

Note 1:   The shutdown command <01> needs to be programmed before sending a one-shot command <11>.

5.3.4.3   ALERT Output Configuration

The ALERT output can be configured as either a comparator output or as Interrupt Output mode using bit 1 of CONFIG. The polarity can also be specified as an active-high or active-low using bit 2 of CONFIG. The following sections describe each output mode, while Figure 5-7 gives a graphical description.

5.3.4.4   Comparator Mode

In Comparator mode, the ALERT output is asserted when T_A is greater than T_{SET}. The pin remains active until T_A is lower than T_{HYST}. The Comparator mode is useful for thermostat-type applications, such as turning on a cooling fan or triggering a system shutdown when the temperature exceeds a safe operating range.

In Comparator mode, if the device enters the Shutdown mode with asserted ALERT output, the output remains active during shutdown. The device must be operating in continuous conversion, with T_A below T_{HYST}, for the ALERT output to be deasserted.

5.3.4.5   Interrupt Mode

In Interrupt mode, the ALERT output is asserted when T_A is greater than T_{SET}. However, the output is deasserted when the user performs a read from any register. This mode is designed for interrupt-driven, microcontroller-based systems. The microcontroller receiving the interrupt will have to acknowledge the interrupt by reading any register from the MCP9800/1/2/3. This will clear the interrupt and the ALERT pin will become deasserted. When T_A drifts below T_{HYST}, the MCP9800/1/2/3 outputs another interrupt and the controller needs to read a register to deassert the ALERT output. Shutting down the device will also reset, or deassert, the ALERT output.
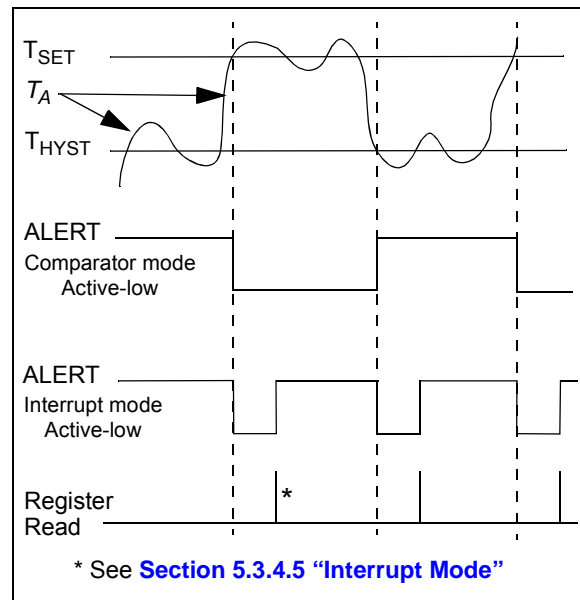

FIGURE 5-7:   *Alert Output.*

5.3.4.6 Fault Queue

The fault queue feature can be used as a filter to lessen the probability of spurious activation of the ALERT pin. T_A must remain above T_{SET} for the consecutive number of conversion cycles selected using the Fault Queue bits. Bit 3 and bit 4 of CONFIG can be used to select up to six fault queue cycles. For example, if six fault queues are selected, T_A must be greater than T_{SET} for six consecutive conversions before ALERT is asserted as a comparator or an interrupt output.

This queue setting also applies for T_{HYST}. If six fault queues are selected, T_A must remain below T_{HYST} for six consecutive conversions before ALERT is deasserted (Comparator mode) or before another interrupt is asserted (Interrupt mode).

5.3.4.7 $\Sigma\Delta$ ADC Resolution

The MCP9800/1/2/3 provides access to select the ADC resolution from 9-bit to 12-bit (0.5°C to 0.0625°C resolution) using bit 6 and bit 5 of the CONFIG register. The user can gain better insight into the trends and characteristics of the ambient temperature by using a finer resolution. Increasing the resolution also reduces the quantization error. Figure 2-3 shows accuracy versus resolution.

Table 5-3 shows the T_A register conversion time for the corresponding resolution.

TABLE 5-3: RESOLUTION AND CONVERSION TIME

Bits	Resolution	t_{CONV} (typical)
9	0.5	30 ms
10	0.25	60 ms
11	0.125	120 ms
12	0.0625	240 ms

5.4 Summary of Power-up Condition

The MCP9800/1/2/3 has an internal Power-on Reset (POR) circuit. If the power supply voltage V_{DD} glitches down to the 1.7V (typical) threshold, the device resets the registers to the power-up default settings.

Table 5-4 shows the power-up default summary.

TABLE 5-4: POWER-UP DEFAULTS

Register	Data (Hex)	Power-up Defaults
T_A	0000	0°C
T_{SET}	A000	80°C
T_{HYST}	9600	75°C
Pointer	00	Temperature register
CONFIG	00	Continuous Conversion Comparator mode Active-low Output Fault Queue 1 9-bit Resolution

At power-up, the MCP9800/1/2/3 has an inherent 2 ms (typical) power-up delay before updating the registers with default values and start a conversion cycle. This delay reduces register corruption due to unsettled power. After power-up, it takes t_{CONV} for the TCN75A to update the T_A register with valid temperature data.

NOTES:

6.0 APPLICATIONS INFORMATION

6.1 Connecting to the Serial Bus

The SDA and SCL serial interface are open-drain pins that require pull-up resistors. This configuration is shown in Figure 6-1.
FIGURE 6-1: Pull-up Resistors On Serial Interface.

The MCP9800/1/2/3 is designed to meet 0.4V (maximum) voltage drop at 3 mA of current. This allows the MCP9800/1/2/3 to drive lower values of pull-up resistors and higher bus capacitance. In this application, all devices on the bus must meet the same pull-down current requirements.

6.2 Typical Application

Microchip provides several microcontroller product lines with Master Synchronous Serial Port modules (MSSP) that include the I^2C interface mode. This module implements all master and slave functions and simplifies the firmware development overhead. Figure 6-2 shows a typical application using the PIC16F737 as a master to control other Microchip slave products, such as EEPROM, fan speed controllers and the MCP9800 temperature sensor connected to the bus.
FIGURE 6-2: Multiple Devices on I^2C™ Bus.

The ALERT output can be wired with a number of other open-drain devices. In such applications, the output needs to be programmed as an active-low output. Most systems will require pull-up resistors for this configuration.

6.3 Layout Considerations

The MCP9800/1/2/3 does not require any additional components besides the master controller in order to measure temperature. However, it is recommended that a decoupling capacitor of 0.1 µF to 1 µF be used between the V_{DD} and GND pins. A high-frequency ceramic capacitor is recommended. It is necessary for the capacitor to be located as close as possible to the power pins in order to provide effective noise protection.

For applications where a switching regulator is used to power the sensor, it is recommended to add a 200Ω resistor in series to V_{DD} to filter out the switcher noise from the sensor. It is also recommended to add the series resistor in applications where a linear regulator is used to step-down a switching regulator voltage to power the sensor. For example, if a linearly regulated 3.3V from a 5V switching regulator is used to power the sensor, add a 200Ω series resistor (refer to Figure 6-3).
FIGURE 6-3: Power-supply Filter using a Single Resistor.

6.4 Thermal Considerations

The MCP9800/1/2/3 measures temperature by monitoring the voltage of a diode located in the die. A low-impedance thermal path between the die and the Printed Circuit Board (PCB) is provided by the pins. Therefore, the MCP9800/1/2/3 effectively monitors the temperature of the PCB. However, the thermal path for the ambient air is not as efficient because the plastic device package functions as a thermal insulator.

A potential for self-heating errors can exist if the MCP9800/1/2/3 SDA and SCL communication lines are heavily loaded with pull-ups. Typically, the self-heating error is negligible because of the relatively small current consumption of the MCP9800/1/2/3. However, in order to maximize the temperature accuracy, the SDA and SCL pins need to be lightly loaded.

APPENDIX A: REVISION HISTORY

Revision C (September 2010)

The following is the list of modifications:

1. Updated **Section 6.3 "Layout Considerations"**.
2. Updated package markings drawings.
3. Removed lead free designation letter G from **Section 7.0 "Packaging Information"** and from the Product Identification System page. All devices are lead free.
4. Added Appendix A: Revision History

Revision B (May 2008)

The following is the list of modifications:

1. Added lead free designation letter G in **Section 7.0 "Packaging Information"** and in the Product Identification System page.

Revision A (October 2004)

• Original Release of this Document.

NOTES:

PRODUCT IDENTIFICATION SYSTEM

To order or obtain information, e.g., on pricing or delivery, refer to the factory or the listed sales office.

PART NO.	XX	X	–X	/XX
Device	Slave Address	Tape & Reel	Temperature Range	Package

Device:
MCP9800: Temperature Sensor
MCP9801: Temperature Sensor
MCP9802: Temperature Sensor
MCP9803: Temperature Sensor

A0 = Slave address set to '000'
A5 = Slave address set to '101'

Tape and Reel:　　 = Blank
　　　　　　　　 T = Tape and Reel

Temperature Range: M = -55°C to +125°C

Package:
OT = Plastic Small Outline Transistor (SOT-23), 5-lead
MS = Plastic Micro Small Outline (MSOP), 8-lead
SN = Plastic SOIC, (150 mil Body), 8-lead

Examples:

a) MCP9800A0T-M/OT — Slave address '000', Tape and Reel, -55°C to +125°C, SOT-23 package.
b) MCP9800A5T-M/OT — Slave address '101', Tape and Reel, -55°C to +125°C, SOT-23 package.

a) MCP9801-M/MS — -55°C to +125°C, 8LD MSOP package.
b) MCP9801T-M/MS — Tape and Reel, -55°C to +125°C, 8LD MSOP package.
c) MCP9801-M/SN — -55°C to +125°C, 8LD SOIC package.
d) MCP9801T-M/SN — Tape and Reel, -55°C to +125°C, 8LD SOIC package.

a) MCP9802A0T-M/OT — Slave address '000', Tape and Reel, -55°C to +125°C, SOT-23 package.
b) MCP9802A5T-M/OT — Slave address '101', Tape and Reel, -55°C to +125°C, SOT-23 package.

a) MCP9803-M/MS — -55°C to +125°C, 8LD MSOP package.
b) MCP9803T-M/MS — Tape and Reel, -55°C to +125°C, 8LD MSOP package.
c) MCP9803-M/SN — -55°C to +125°C, 8LD SOIC package.
d) MCP9803T-M/SN — Tape and Reel, -55°C to +125°C, 8LD SOIC package.
